

BuilderFax

Eliminating Workforce Fog: A Systems-Level Redesign of the BuilderFax Experience Flow.

Shifting from a static, white-collar CV model to a dynamic, "Role-First" data architecture, a connected identity wallet built for the realities of the global blue-collar workforce.

INTERACTIVE PROTOTYPE
in VIDEO

Construction careers do not follow corporate trajectories. Tradespeople define their professional identity by certifications and physical on-site hours—not static PDF resumes.

System Audit & The Friction Points

The current BuilderFax app assumes a standard corporate user experience, which breaks down on an active construction site. By relying on digital resumes, broken input components, and missing system feedback, the application forces tradespeople into a high friction data entry loop.

01 / Onboarding Funnel

The Resume Dead End & Silent Failures

THE PROBLEM
The onboarding flow funnels users toward uploading a digital CV. If the PDF upload fails, the system provides zero error feedback, leaving the user completely stuck.

THE REALITY
Tradespeople rely on physical dispatch slips. Pushing them toward a white collar PDF flow is a mismatch, and failing silently when a document is rejected violates basic error prevention heuristics.

Heuristic #6: Error Prevention

High Cognitive Load

THE PROBLEM
The manual entry screen demands heavy typing across seven separate fields.

THE REALITY
Forcing a worker to type specific daily tasks into a blank description box on a mobile keyboard violates the recognition over recall usability heuristic.

Heuristic #6: Recognition Over Recall

Rigid File Management

THE PROBLEM
Users cannot rename an uploaded image or document within the system.

THE REALITY
If a worker uploads a photo of a dispatch slip and the phone names it "IMG_4920", they are stuck with that generic file name. This causes organizational chaos when trying to share specific credentials with a site supervisor.

Heuristic #5: User Control & Freedom

The Repetitive Entry Loop

THE PROBLEM
After enduring the manual setup, the app drops the user onto the main profile page.

THE REALITY
To add a second job site, the user must navigate back and restart the exact same blank form from scratch. There is no mechanism to duplicate past roles or batch multiple sites under a single trade.

Heuristic #3: System Loop Redundancy

Redefining the Data Engine: Direct Handshakes with Enterprise Construction Sources

Rather than simply putting a fresh coat of paint on a frontend form, this solution connects BuilderFax directly to the enterprise platforms where construction data already lives, intentionally bypassing the "Upload Resume" flow.

Select Once, Add Many: The Task Architecture

Workers define their overarching trade role exactly one time. Once locked, multiple short-term job sites, contractors, and timelines are nested underneath, completely eliminating form duplication.

Screen by Screen Walkthrough

A high-contrast mobile design system engineered for outdoor job site glare, dirty fingers, and rapid supervisor gate verification.

DESIGNED FOR THE REAL WORLD.

01 / Entry Architecture

The Source Hub: Zero-Typing Ingestion

THE ARCHITECTURAL SOLUTION
The legacy onboarding funnel forced every user to upload a fragmented PDF resume upload that failed silently. The redesigned Source Hub opens a multi-modal ingestion gateway: 1-tap Lumber ecosystem handshake, regional contractor connectors (Procore, ADP, NCCER, HCSS), camera OCR scanning for physical union tickets, and structured manual entry.

FIELD ERGONOMICS & SITE REALITY
Features generous 48px+ touch targets optimized for single-handed thumb reach and dirty gloves. Eliminates onboarding abandonment by meeting tradespeople wherever their records live.

Heuristic #7: Flexibility & Efficiency of Use

02 / Progressive Trade Lock

Step 1: Your Role — Trade Classification & Fast-Picks

THE ARCHITECTURAL SOLUTION
Rather than treating every job site as an isolated form, the system decouples the master trade qualification from individual employers. Users establish their core classification once, which then anchors all past and future build sites.

FIELD ERGONOMICS & SITE REALITY
Equipped with "Existing Roles in Profile (Quick Pick)" and tactile role chips (Commercial Plumber, HVAC Tech, Heavy Equipment, Farmer) with intelligent trade classification auto-mapping. Replaces blank typing fields with recognition-based taps.

Heuristic #6: Recognition Over Recall

03 / Career Proof & Badging

Role-Wise Profile: Credential Wallet & Pay Proof

THE ARCHITECTURAL SOLUTION
Standard white-collar resumes treat each company as a separate entry, diluting a tradesperson's overall seniority. The Role-Wise profile rolls fragmented subcontracting stints up into consolidated trade buckets, tracking total logged hours and milestone thresholds.

FIELD ERGONOMICS & SITE REALITY
Generates authoritative qualification badges like **Journeyman Qualified (>2,000 Met)** with visual progress indicators. Gives tradespeople undeniable proof of pay grade eligibility for union halls and general contractors.

Heuristic #2: Match Between System & Real World

04 / Continuous Audit Rail

Chronological Project Rail: Continuous History

THE ARCHITECTURAL SOLUTION
While role batching proves trade mastery, site superintendents frequently need chronological proof to verify recent safety compliance and active job-site tenures over the preceding 12 months.

FIELD ERGONOMICS & SITE REALITY
Renders a continuous vertical project rail showing sequential contractor stints, active ongoing roles, verified payroll synchronization tags, and exact project durations at a single glance.

Heuristic #4: Consistency & Standards

05 / Match Between System & Real World

The Heuristic Radar & Evaluation

A standardized 1 to 10 Nielsen Norman heuristic evaluation scoring the current legacy onboarding flow against the proposed Role-First architecture.
